Daily Disinfection

Regular disinfection is warranted with growing outbreak

Given data that has been developed regarding the persistence of SARS-CoV-2 on surfaces, the regular disinfection of surfaces is critical to prevent the spread of infection. A daily apparatus disinfection checklist has been developed to provide guidance for crews. Additionally, SCBA regulators will need to be disinfected daily in order to ensure that this virus isn't transmitted via a contaminated regulator. The need to disinfect the regulator includes after the daily seal check, in case the SCBA is not used again during that shift.
